Art Unit: 3682

DETAILED ACTION

1. The finality of the previous Office Action dated 2/14/07 is withdrawn and a new action on the merits follows.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Reasoner et al, USP 6,230,579, in view of Osborn, USP 5,277,077.

Re clm 1, Reasoner discloses a shifter mechanism comprising, in combination:

- A shifter lever (42) movable along a shift path
- A detent plate (70) movable with the shifter lever (42) along the shift path
 and forming a detent profile defining a plurality of gear positions (Figure 2)
- A pawl (74) movable between a locking position wherein the pawl engages the detent profile to lock the shifter lever in one of the plurality of gear positions against movement and an unlocking position wherein the shifter lever is movable along the shift path between the plurality of gear positions
- An actuator (72) operatively coupled to the pawl (74) to selectively move the pawl (74) from the locking to the unlocking position

Art Unit: 3682

Reasoner does not disclose that the pawl includes a roller that engages the detent profile.

Osborn teaches a pawl (42) that includes a roller (43) that engages the detent profile for the purpose of providing a shift lever handle assembly having a limited number of parts and constructed of parts that can be actuated more smoothly and with less effort (C2/L30-35).

It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the teachings of Reasoner and provide a pawl that includes a roller that engages the detent profile, as taught by Osborn for the purpose of providing a shift lever handle assembly having a limited number of parts and constructed of parts that can be actuated more smoothly and with less effort.

Re clm 2, Reasoner discloses that the detent profile includes a plurality of grooves (see Figure 2, spherical recesses 76).

Re clm 3, the actuator (72) is a linear actuator having a pin (74 is a pin) extendable along a linear path.

Re clm 5, the pin (90) is in an extended position when said actuator (56) is energized and a retracted position when said actuator is unenergized (see paragraph 0033).

Re clm 6, the pin is in an extended position when the pawl (74) is in the unlocked position and a retracted position when the pawl (74) is in the locking position (the pin/pawl moves into the groove to lock and out of the groove to unlock).

Art Unit: 3682

Re clm 7, Reasoner in view of Osborn discloses the roller (Osborn 43) is rotatably secured to a detent lever (Reasoner pin/pawl 74 is a lever) and the detent lever is pivotable to move the pawl between the locking position and the unlocking position.

Re clms 8 and 9, Reasoner in view Osborn discloses that the pawl (Osborn 42) moves along an arcuate path between the locking position and the unlocking position {clms 8 and 9} and the actuator (Reasoner72) is a linear actuator which is operatively connected to the detent lever to pivot the detent lever along the arcuate path {clm 8}.

NOTE: a pivot as defined by Webster's II New Riverside Dictionary as something on which the direction, development or effect on something else depends.

Re clm 4, Reasoner in view of Osborn discloses all the structural limitations as applied to claim 3 above.

Reasoner in view of Osborn, as applied above, does not disclose that the actuator is a solenoid.

Reasoner teaches using a solenoid (78) with another pawl arrangement (54) for the purpose of providing a means for preventing the pawl from being moved out of position unless the brake pedal is depressed (C3/L2-5).

It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the teachings of Reasoner in view of Osborn and make the actuator (72) a solenoid, as taught by Reasoner, for the purpose of providing a means for preventing the pawl from being moved out of position.

Art Unit: 3682

4. Claims 10-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Reasoner et al, USP 6,230,579, in view of Kataumi, USP 5,445,046.

Re clm 10, Reasoner discloses a shifter mechanism comprising, in combination:

- A shifter lever (42) movable along a shift path
- A detent plate (70) movable with the shifter lever (42) along the shift path and forming a detent profile defining a plurality of gear positions (Figure 2 recesses 76)
- A pawl (74) movable between a locking position wherein the pawl
 engages the detent profile to lock the shifter lever in one of the plurality of
 gear positions against movement along the shift path and an unlocking
 position wherein the shifter lever is movable along the shift path between
 the plurality of gear positions
- A pivotable detent lever (the middle portion of pawl 74 is a lever) carrying
 the pawl
- A linear actuator (56) operatively coupled to the pawl (54) to selectively move the pawl (54)

Reasoner does not disclose that the pawl moves in an arcuate path.

Kataumi teaches a pawl (30) that is moved by an actuator (spring) in an arcuate path for the purpose of engaging a plurality of detent teeth in a releaseable manner (C1/L36-54).

Art Unit: 3682

It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the teachings of Reasoner and provide a pawl (30) that is moved by an actuator in an arcuate path, as taught by Kataumi, for the purpose of engaging a plurality of detent teeth in a releaseable manner.

Re clm 11, Reasoner discloses that the detent profile includes a plurality of grooves (see Figure 2).

Re clm 12, the actuator (72) is a linear actuator having a pin (shaft of 74) extendable along a linear path.

Re clm 14, the pin (90) is in an extended position when said actuator (56) is energized and a retracted position when said actuator is unenergized (see paragraph 0033).

Re clm 15, the pin is in an extended position when the pawl (54) is in the unlocked position and a retracted position when the pawl (54) is in the locking position (see Figures 5 and 6).

Re clm 13-15, Reasoner in view of Osborn discloses all the structural limitations as applied to claim 12 above.

Reasoner in view of Osborn, as applied above, does not disclose that the actuator is a solenoid.

Reasoner teaches using a solenoid (78) with another pawl arrangement (54) for the purpose of providing a means for preventing the pawl from being moved out of position unless the brake pedal is depressed (C3/L2-5).

It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the teachings of Reasoner in view of Osborn and make the actuator (72) a solenoid, as taught by Reasoner, for the purpose of providing a means for preventing the pawl from being moved out of position.

Re clm 14, the pin (74) is in an extended position when said actuator/solenoid (72) is energized and a retracted position when said actuator/solenoid is unenergized (see paragraph 0033).

5. Claims 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Reasoner '579, in view of Kataumi '046, and further in view of Osborn, USP 5,277,077.

Re clm 16, Reasoner in view of Kataumi discloses all of the claimed subject matter above.

Reasoner in view of Kataumi does not disclose that the pawl includes a roller that engages the detent profile.

Osborn teaches a pawl (42) that includes a roller (43) that engages the detent profile for the purpose of providing a shift lever handle assembly having a limited number of parts and constructed of parts that can be actuated more smoothly and with less effort (C2/L30-35).

It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the teachings of Reasoner in view of Kataumi and provide a pawl that includes a roller that engages the detent profile, as taught by Osborn for the Art Unit: 3682

purpose of providing a shift lever handle assembly having a limited number of parts and constructed of parts that can be actuated more smoothly and with less effort.

Re clm 17, Osborn discloses that the roller (43) is rotatably secured to the detent lever (40).

Allowable Subject Matter

6. Claims 18-20 are allowed.

Response to Arguments

7. Applicant's arguments with respect to claims 1-17 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
